Preliminary

A = 0 = (0)*2^1 + (0)*2^0 = 00 in binary
C = 1 = (0)*2^1 + (1)*2^0 = 01 in binary
G = 2 = (1)*2^1 + (0)*2^0 = 10 in binary
T = 3 = (1)*2^1 + (1)*2^0 = 11 in binary

The use of the term datavector is meant to imply the 2-layer list (which is also a vector in mathematica) containing a given list of data.
For example {{0,1,2,3,4}} is the datavector containing digits 0 to 4 in order

At some point, want to define a function that will take a DNA set of some # 2^(n-1) < d < 2^n base pairs and fill it with 0's until d = 2^n for some whole number n.
Likely need to use a While[] fn.
Also SparseArray Fn

Look at what you can do with ArrayFlatten fn

Get less singular values from SVD for systems with less entanglement
Perfectly classical systems have no entanglement, therefore they only have 1 singular value
Take operator $\hat{X}$ in some large dimensional Hilbert space. Then it's classical form could be reduced down to 1 singular value, so $\hat{X} \rightarrow x$ by SVD

```
M = {{1, 2, 3}, {2, 1, 4}, {3, 4, 1}};
```

```
{u, w, v} = SingularValueDecomposition[N[M]]
```

```
{{{-0.505785, 0.255232, 0.824038},
  {-0.584374, 0.601302, -0.544925}, {-0.634577, -0.757161, -0.154979}},
 {{7.07467, 0., 0.}, {0., 3.18788, 0.}, {0., 0., 0.886791}},
 {{-0.505785, -0.255232, -0.824038},
  {-0.584374, -0.601302, 0.544925}, {-0.634577, 0.757161, 0.154979}}}
```

Need to operate on N[M] rather than just M, otherwise slots appear in the expression, which increases the computation time too much.

```
u.w.Transpose[v]
```

```
{{1., 2., 3.}, {2., 1., 4.}, {3., 4., 1.}}
```

$$\begin{pmatrix} 1 & 0 & 0 \\ 0 & 1 & 0 \\ 0 & 0 & 1 \end{pmatrix}$$

```
{u1, w1, v1} = SingularValueDecomposition[{{1, 2}, {1, 2}}]
```

$$\left\{\left\{\frac{1}{\sqrt{2}}, -\frac{1}{\sqrt{2}}\right\}, \left\{\frac{1}{\sqrt{2}}, \frac{1}{\sqrt{2}}\right\}\right\}, \left\{\left\{\sqrt{10}, 0\right\}, \{0, 0\}\right\}, \left\{\left\{\frac{1}{\sqrt{5}}, -\frac{2}{\sqrt{5}}\right\}, \left\{\frac{2}{\sqrt{5}}, \frac{1}{\sqrt{5}}\right\}\right\}$$

```
u1.w1.Transpose[v1]
```

```
{{1, 2}, {1, 2}}
```

Can use FortranForm function to convert mathematica to Fortran, which has a similar syntax to python. Helpful when unsure of how to structure a code.
Can import Fortran codes to mathematica in order to deal with operations which are much difficult to do in code. For instance, can import a code containing integrals,
use splice to do the integrals then have it output back to the fortran file.

```
FortranForm[SingularValueDecomposition[N[A]]]
```

```
SingularValueDecomposition(A)
```

Use SVD code from https://jeremykun.com/2016/05/16/singular-value-decomposition-part-2-theorem-proof-algorithm/
Just need to replace curly brackets here with square brackets for python and the matrix below with the appropriate genetic info vector

```
from numpy.linalg import svd

movieRatings = [
  [2, 5, 3],
  [1, 2, 1],
  [4, 1, 1],
  [3, 5, 2],
  [5, 3, 1],
  [4, 5, 5],
  [2, 4, 2],
  [2, 2, 5],
]

U, singularValues, V = svd(movieRatings)
```

```
{{2, 5, 3},
 {1, 2, 1},
 {4, 1, 1},
 {3, 5, 2},
 {5, 3, 1},
 {4, 5, 5},
 {2, 4, 2},
 {2, 2, 5}}
```

This is tha mathematica form so you can compare SVD in python to the SVD done in mathematica to make sure everything checks out, done explicitly in the next cell

```
Do[Print[SingularValueDecomposition[N[{{2, 5, 3},
  {1, 2, 1},
  {4, 1, 1},
  {3, 5, 2},
  {5, 3, 1},
  {4, 5, 5},
  {2, 4, 2},
  {2, 2, 5}}]][[i]] // MatrixForm], {i, 1, 3}]
(* Gives the components of the SVD of the python example *)
```

$$\begin{pmatrix} -0.394585 & -0.239236 & -0.354459 & -0.380622 & -0.298368 & -0.494648 & -0.307032 & -0.297633 \\ -0.158302 & -0.0305491 & -0.152998 & -0.453348 & 0.311229 & 0.23892 & -0.373133 & 0.672235 \\ -0.221552 & 0.520861 & 0.393349 & -0.149748 & -0.65964 & 0.00488292 & -0.00783684 & 0.259346 \\ -0.396926 & 0.0864901 & -0.410529 & 0.743874 & -0.106295 & 0.0137257 & -0.179593 & 0.263335 \\ -0.346303 & 0.641288 & 0.0738286 & -0.0449415 & 0.580007 & -0.258062 & 0.00211823 & -0.241547 \\ -0.533474 & -0.191689 & 0.199493 & -0.039426 & 0.00424495 & 0.687157 & -0.0695756 & -0.40033 \\ -0.316605 & -0.0610983 & -0.305995 & -0.196118 & -0.0133427 & 0.0144698 & 0.851859 & 0.194635 \\ -0.328402 & -0.459704 & 0.623548 & 0.178304 & 0.176312 & -0.398795 & 0.060659 & 0.257716 \end{pmatrix}$$

$$\begin{pmatrix} -0.541848 & 0.751523 & 0.376316 \\ -0.67071 & -0.116809 & -0.732464 \\ -0.506506 & -0.649283 & 0.567347 \end{pmatrix}$$

Note that the results are the same as those obtained in python except the rows and columns are switched in the python one (which has the same bracket setup, may be able to fix this by some arrangement of brackets)

Repeat ~n/2 times Might be best to do some orderings in mathematica.

Need to learn how to access DNA data from an online database using python or Fortran and how to incorporate that into code

Flatten[H1Avec][[(70 * 11) + 2]]
```

2

So Flatten[H1Avec][[k]] = H1Avec[[1, k]]

SVD of H1Avec (Not important except for examples of methods used)

Note: H1Avec vector has 781 digits, didn't put in fillers to get to 2^10 =1024 yet, but seem to be getting good results.

```
PrimeQ[781]
```

```
False
```

```
(*SingularValueDecomposition[N[H1Avec]]*)
```

Very large but note alot of repeating numbers. Some are
0.
-0.0624323
-0.0416215
-0.0208108
-0.001222910
-0.00244583
-0.00366874
-0.000815276

This function only breaks H1Avec down to 3 matrices (can check this fact more quickly using ctrl F on double brackets {{) , not decomposing every number.

So the high degree of repetition here likely implies a high degree of correlation. (Check with Dr. Muccciolo)

```
(*SingularValueDecomposition[N[H1Avec]][[1]]*)
```

```
(*SingularValueDecomposition[N[H1Avec]][[2]] *)
(* double bracket [[]] calls the matrix*)
```

So the first matrix of the SVD only has one term, the second matrix only has 1 non-zero term. Is the 2nd matrix empty just because of the nature of this SVD or because there's a high degree of correlation
So almost all of the relevant info is contained in the the 3rd matrix, so this is the only one that needs to be decomposed further.

Also: want to see how many unique numbers there are in this decomposition - use Gather function on 3rd matrix for this purpose

```
(*SingularValueDecomposition[N[H1Avec]][[1]][[1]]*)
```

Use SingularValueDecomposition[N[H1Avec]][[3]][[k]] to call the 3rd matrix as a list

```
(*Length[SingularValueDecomposition[N[H1Avec]][[3]]]*)
```

Can check that
SingularValueDecomposition[N[H1Avec]][[3]][[781]] exists while

SingularValueDecomposition[N[H1Avec]][[3]][[782]] doesn't

So want to join SingularValueDecomposition[N[H1Avec]][[3]][[k]], k∈{1, 781} into one list and then use gather function

```
(* Gather[SingularValueDecomposition[N[H1Avec]][[3]][[782]]] *)
(*SingularValueDecomposition[N[H1Avec]][[2]]*)
(*SingularValueDecomposition[N[H1Avec]][[3]][[1]]*)
(*SVD3List=Table[Union[SingularValueDecomposition[N[H1Avec]][[3]][[k]]],{k,1,781}];*)
```

Union removes repeated elements from each SingularValueDecomposition[N[H1Avec]][[3]][[k]]

Use Flatten fn to remove extra list brackets

```
(*Union[Flatten[SVD3List]]*)
(*Length[SVD3List]*)
(*H1AfirstSVDuniqueterms=Union[Flatten[SingularValueDecomposition[N[H1Avec]]]]*)
(*Length[H1AfirstSVDuniqueterms]*)
```

Only 19 unique numbers in the SVD of 781 base pair long Histone H1Avec gene!

And this is only the first SVD, need to / can do up to 5, since 1024 = 2^10 = 4^5 > 781 > 2^9 = 4^(4.5) = 512, (4-bit)

```
(*Length[Union[Flatten[SingularValueDecomposition[N[H1Avec]]]]]*)
(* Part we need for 1st SVD of genes below *)
```

Further want to do rest of SVDs

Also change ordering of the base pairs and see what that does to the SVD and the number of unique terms and the values of the unique terms

Now we construct a matrix from this vector data, since we can perform a meaningful SVD on this matrix, but an SVD of a vector doesn't tell us much

781 = 11 * 71 when prime decomposed, so we make a 11x71 matrix

May also use a filler to get H1Avec to be a power of 2 so that after each SVD it breaks down to a lesser power of 2 until we get to 1x1 matrices

Note that Flatten[H1Avec][[k]] = H1Avec[[1, k]] is just the k-th term of the vector, do this to remove the lists

```

So H1A is 11x71, as desired

SVD of H1A

```
SingularValueDecomposition[N[H1A]] (* 1st SVD, need more,
for a filled 2^n data st, need about n/2 or (n-1)/2 SVDs, CHECK *)
```

```
{ ··· 1 ··· }
large output | show less | show more | show all | set size limit...
```

For a filled 2^n data st, need about n/2 or (n-1)/2 SVDs, CHECK
Sould be ~ n/2 since 2^n = 4^(n/2) and we have 4 bases (00,01,10,11)
Need to SVD further, but can't just do $H1ASVD_2$ = SingularValueDecomposition[$H1ASVD_1$] for a non 2^n data set, I don't think, need to round it out first

For some 2^n dataset could define a function
SVD[i_,M_]:=Nest[SingularValueDecomposition,N[M], i]
Which gives the i-th SVD of a matrix M

Then to get a list of SVDs from the 1st to the $\frac{(n-1)}{2}$ SVD, do Table[SVD[i_,M_],{i,1,Ceiling[$\frac{(n-1)}{2}$]}]
Note: Either $\frac{(n-1)}{2}$ or $\frac{n}{2}$ is a whole number, depends on n. For 2^n = 1024 = 4^(n/2), $\frac{n}{2}$ = 5, do SVD 5 times, Use Ceiling[$\frac{(n-1)}{2}$], which will use whichever of these is the whole number

Need SVD[i_,M_] to perform i-th SVD on middle matrix of the (i-1)-th SVD, since SVD technically gives 3 matrices . Use Part to specify this condition within the nest

```
(* A={{1,2,3},{4,5,6},{7,8,9}}
  SingularValueDecomposition[N[A]]
  SingularValueDecomposition[N[A]][[2]]
  SingularValueDecomposition[SingularValueDecomposition[N[A]][[2]]]*)

SingularValueDecomposition[
  SingularValueDecomposition[SingularValueDecomposition[N[H1A]][[2]]][[2]]];
```

```
SVD[i_, M_] := Nest[SingularValueDecomposition[Part[#, 2]] &,
   SingularValueDecomposition[N[M]], i - 1];
 (* Defines i-th SVD of matrix M for i>0 *)
```

This does The SVD directly on matrix M iff i = 1, otherwise, for i > 1, it does the SVD on the middle matrix of the previous SVD.
If we want to do the SVD on another part of the matrix, modify the part function

```
(* Λ[i_,M_]:=SVD[i,M][[2]]; *)
(* Defines the middle matrix of the i-th SVD of matrix M *)

SVD[2, H1A];(* Output should show that it's defined as desired *)

(* n =10 here if we were to fill H1Avec up to 1024 = 2^10 places *)

(* Table[SVD[i,M_],{i,1,Ceiling[(n-1)/2]}] *)

SVD[1, H1A]; (*NOTE: Middle matrix mostly 0,
as desired! But others don't have many 0's or repeating numbers*)

Flatten[SVD[1, H1A]]
Union[Flatten[SVD[1, H1A]]];
Length[Union[Flatten[SVD[1, H1A]]]]
Length[Flatten[SVD[1, H1A]]]
Count[Flatten[SVD[1, H1A]], 0.] (* Important to make it find 0., not 0,
as we add periods to every term in defining SVD[i_,M_] in terms of N[M] *)

```
5174/5943 // N
```

```
0.870604
```

So 87% of terms of entire SVD are unique - although we mainly care about middle matrix
Now look at this middle matrix SVD[1,H1A][[2]] :

```
SVD[1, H1A][[2]] // MatrixForm;
SVD[2, H1A][[2]] // MatrixForm;
SVD[3, H1A][[2]] // MatrixForm;
SVD[52, H1A][[2]] // MatrixForm; (* All equal *)
```

So can't make this any simler, want to SVD the other matrices SVD[1,H1A][[1]] and SVD[1,H1A][[3]]
Want program to take the first SVD, so M -> U.Λ.V , Λ = eigenvalue matrix
then decompose each of those, Λ -> $\mathcal{I}$.Λ.$\mathcal{I}$ ($\mathcal{I}$= identity), U -> U1.Λu1.U2, V -> V1.Λv1.V2,
U1.Λu1.U2 U1.Λu1.U2 U1.Λu1.U2 U1.Λu1.U2
U1.Λu1.U2 U1.Λu1.U2 U1.Λu1.U2 U1.Λu1.U2 U1.Λu1.U2 U1.Λu1.U2
U1.Λu1.U2 U1.Λu1.U2
Do that Ceiling$\left[\frac{(n-1)}{2}\right]$ times (5 max in this case, since n=10 with filler)
Then will have set of 3^5 such matrices
Exclude the identities then use Union fn on this set to get

Also need to factor U,V so that they're some prime x some prime in size

```

These are the W from W_0 up to $W_{npow-1} = W_9$ per step 9 in the notes.

W_9 is a vector so we recover a scalar S later, as we want

Also add `+ 1` to both defining sides of W1

The above is a rearranged form of the W1 in the notes??? but contains all the terms, so we'll work with this for now (very difficult to rearrange in that way)

Now in order to define W1 as in the notes, let

$2(i-1)+1+j0 = x$

so that $i = \frac{(x - j0 - 1)}{2} + 1$

$\frac{((j-1)-j0)}{2} + 1 = \frac{y}{2}$

```
(* Defined like this so that j is integer for integer y *)
```

$$\text{so that } j = 2\left(\frac{y}{2} - 1\right) + j0 + 1 = y + j0 - 1$$

$$(j+1) - j0 = y$$

So $j = 1 \Rightarrow y = (1+1) - 1 = 1$

So $j = 256 \Rightarrow y = (256+1) - 0 = 257$

$j0 = 0$ if j even, $= 1$ if j odd

So y is odd for all values of j

x is even iff j is odd (so $j0 = 1$ for even x)

x is odd iff j is even (so $j0 = 0$ for odd x)

So use the function

```
Ω[x_, y_] := If[OddQ[x], WP[(x + 1)/2, y - 1], WP[(x)/2, y]]
```

$$i \in \{1, 2\} \Rightarrow x \in \{1, 2, 3, 4\}$$

$$j \in \left\{1, \ldots, \frac{\text{FilledSize}}{(2\text{^}(0+2))}\right\} = \{1, \ldots, 256\} \Rightarrow y \in \{1, \ldots, \sim 256\}$$

```

Recombining terms

$W_0 = U_0 . \sqrt{\Lambda_1} . \left(\sqrt{\Lambda_1} . V_1 \right) = M_0 . W_1 =$

It's fine that we altered the # of columns of the W's in the main iteration function, now need to find the M's. M's are what we're really recombining.

SVD of H1Avec (Not important except for examples of methods used)

Note: H1Avec vector has 781 digits, didn't put in fillers to get to 2^10 =1024 yet, but seem to be getting good results.

```
PrimeQ[781]
```

```
False
```

```
(*SingularValueDecomposition[N[H1Avec]]*)
```

Very large but note alot of repeating numbers. Some are

0.

-0.0624323

-0.0416215

-0.0208108
-0.001222910
-0.00244583
-0.00366874
-0.000815276

This function only breaks H1Avec down to 3 matrices (can check this fact more quickly using ctrl F on double brackets {{) , not decomposing every number.

So the high degree of repetition here likely implies a high degree of correlation. (Check with Dr. Muccciolo)

```
(*SingularValueDecomposition[N[H1Avec]][[1]]*)
```

```
(*SingularValueDecomposition[N[H1Avec]][[2]] *)
(* double bracket [[]] calls the matrix*)
```

So the first matrix of the SVD only has one term, the second matrix only has 1 non-zero term. Is the 2nd matrix empty just because of the nature of this SVD or because there's a high degree of correlation
So almost all of the relevant info is contained in the the 3rd matrix, so this is the only one that needs to be decomposed further.

Also: want to see how many unique numbers there are in this decomposition - use Gather function on 3rd matrix for this purpose

```
(*SingularValueDecomposition[N[H1Avec]][[1]][[1]]*)
```

Use SingularValueDecomposition[N[H1Avec]][[3]][[k]] to call the 3rd matrix as a list

```
(*Length[SingularValueDecomposition[N[H1Avec]][[3]]]*)
```

Can check that
SingularValueDecomposition[N[H1Avec]][[3]][[781]] exists while
SingularValueDecomposition[N[H1Avec]][[3]][[782]] doesn't

So want to join SingularValueDecomposition[N[H1Avec]][[3]][[k]], k∈{1, 781} into one list and then use gather function

```
(* Gather[SingularValueDecomposition[N[H1Avec]][[3]][[782]]] *)
```

```
(*SingularValueDecomposition[N[H1Avec]][[2]]*)
```

```
(*SingularValueDecomposition[N[H1Avec]][[3]][[1]]*)
```

```
(*SVD3List=Table[Union[SingularValueDecomposition[N[H1Avec]][[3]][[k]]],{k,1,781}];*)
```

Union removes repeated elements from each SingularValueDecomposition[N[H1Avec]][[3]][[k]]
Use Flatten fn to remove extra list brackets

```
(*Union[Flatten[SVD3List]]*)

(*Length[SVD3List]*)

(*H1AfirstSVDuniqueterms=Union[Flatten[SingularValueDecomposition[N[H1Avec]]]]*)

(*Length[H1AfirstSVDuniqueterms]*)
```

Only 19 unique numbers in the SVD of 781 base pair long Histone H1Avec gene!

And this is only the first SVD, need to / can do up to 5, since 1024 = 2^10 = 4^5 > 781 > 2^9 = 4^(4.5) = 512, (4-bit)

```
(*Length[Union[Flatten[SingularValueDecomposition[N[H1Avec]]]]]*)
(* Part we need for 1st SVD of genes below *)
```

Further want to do rest of SVDs
Also change ordering of the base pairs and see what that does to the SVD and the number of unique terms and the values of the unique terms

Put in terms of npow so that we don ' t have to change it if we change the datavector M, as npow already includes that change in size

It ' s npow -3 since the algorithm is structured

This ^ tells us the number of Singular values
 contained in the SVD of W_i given as {i, ⌗ of singular values}
e.g. The SVD of W_4 has 15 singular vaulues
So in total we have 56 singular values for H1A !
And 56 < 2^8 = 256, so decomposes nicely
Increases geometrically for a bit but turns around at the SVD of W_4

Note : the W_i are defined as in step 4 of the notes,
this is why the SVD of W_9 can ' t be defined
The Λ parts of the SVDs are shown below

```

Can SVDs of DNA be used to study mutations ?

Some SVD algorithms designed to predict wether patterns and disease outbreaks. Might they be similaly used to study mutability of a given gene ?

Porcine Circovirus Type 2 samples

PCV2$_1$ is from GenBank: LF939182.1

>>> Note that Length of PCV2 samples is 1767, whereas PCV1 samples are 1759, so we would need to fill the PCV1 samples a bit if we wish to compare them

Explanation of samples

Note that in these samples there is no particular ordering
Also, if samples have roughly same number of opposite base pairs but significant differences between the number of each base pair, i.e. one sample has roughly 1400 A (0), 500 T (3), whereas the other has 500 A (0), 1400 T (3), we can reasonably conclude that the respective authors/sources read simply switched the base pairs and make the necessary adjustment 0<->3 and/or 1<->2

Porcine circovirus type 1 used (There are different types of viruses under this same species)
Only samples with 1759 base pairs used here

According to tile of research cited in (https://www.ncbi.nlm.nih.gov/nuccore/KJ408798.1) there is a "Lack of genetic diversity in newly sequenced porcine circovirus type 1 strains isolated 20 years apart" based on similarities between samples $PCV1_2$ and $PCV1_3$, which were both examined in that paper.

$PCV1_1$ is from GenBank: JX566507.1
$PCV1_2$ is from GenBank: KJ408798.1
$PCV1_3$ is from GenBank: KJ408799.1 (different samples found 20 yeas apart, just from the same authors, so filed at same time)
$PCV1_4$ is from GenBank: AY754015.1 (Australian strain, so *might* differ a bit more) (***Note:*** we modified this one from it's GenBank source by moving a 46 letter gene which was at the end to the front, as explained below)

```
(PCV1₁ - PCV1₂)[[1, All]]; (* Gives list of difference beween each base pair*)
```

```
Count[(PCV1₁ - PCV1₂)[[1, All]], Except[0]]
(* Number of differences between PCV1₁ and PCV1₂ *)
10
```

```
NumDifferencesPCV1[i_, j_] := Count[(PCV1ᵢ - PCV1ⱼ)[[1, All]], Except[0]]
 (* Number of differences between PCV1ᵢ and PCV1ⱼ *)
Table[NumDifferencesPCV1[i, j], {i, 1, 4}, {j, 1, 4}] // MatrixForm
```

$$\begin{pmatrix} 0 & 10 & 10 & 1324 \\ 10 & 0 & 4 & 1325 \\ 10 & 4 & 0 & 1322 \\ 1324 & 1325 & 1322 & 0 \end{pmatrix}$$

This was the number of differences before we modified $PCV1_4$ as explained below

The above table tells us that 1,2, and 3 are nearly the same whereas 4 is drastically different. Although this difference
Use Reverse function to flip $PCV1_4$ to make sure it's not just tanscribed in reverse

The matrix will have zeroes only on the diagnols if damples are only the same as themselves

Can see that ctrl+F on the sequence 1, 3, 0, 0, 3, 0, 1, 2, 2, 3, 0, 2, 3, 0, 3, 3, 2, 2, 0, 0, 0, 2 shows it can be found in both $PCV1_3$ and $PCV1_4$, so it being reversed is not likely the issue

Searching for 1,1,3,3,1,1 shows this sequence in the same location in the first 3 PCV1 samples but 46 places earlier in $PCV1_4$, and further inspection shows that the first 3 samples start off with a 46 letter apparent gene {0,1,1,0,2,1,2,1,0,1,3,3,1,2,2,1,0,2,1,2,2,1,0,2,1,0,1,1,3,1,2,2,1,0,2,1,2,3,1,0,2,3,2,0,0,0} which appears at the very end of $PCV1_4$
Therefore we modify $PCV1_4$ from its GenBank source, placing this 46 letter gene in front to match the other samples

```
Length[{0, 1, 1, 0, 2, 1, 2, 1, 0, 1, 3, 3, 1, 2, 2, 1, 0, 2, 1, 2,
  2, 1, 0, 2, 1, 0, 1, 1, 3, 1, 2, 2, 1, 0, 2, 1, 2, 3, 1, 0, 2, 3, 2, 0, 0, 0}]
```

46

```
Table[NumDifferencesPCV1[i, j], {i, 1, 4}, {j, 1, 4}] // MatrixForm
```

$$\begin{pmatrix} 0 & 10 & 10 & 8 \\ 10 & 0 & 4 & 3 \\ 10 & 4 & 0 & 4 \\ 8 & 3 & 4 & 0 \end{pmatrix}$$

From this we can see that this modification of $PCV1_4$ is has an ordering of genes in alignment with the rest of the samples

Numerically Sorted Samples

One advantage of numerically sorting the samples is that we can get a sense of the difference between two samples without having to worry about what order the authors of the sample source trancribed the genetic code in - sorting the genes becomes impractical for larger genomes
Another is that large differences can tell us

```
Do[NumPCV1ᵢ = Sort[PCV1ᵢ[[1, All]]], {i, 1, 4}]
```

```
Table[NumPCV1ᵢ, {i, 1, 4}];
```

```
NumPCV1₁ – NumPCV1₂;
```

```
Table[Count[(NumPCV1ᵢ – NumPCV1ⱼ), Except[0]], {i, 1, 4}, {j, 1, 4}] // MatrixForm
```

$$\begin{pmatrix} 0 & 5 & 3 & 4 \\ 5 & 0 & 2 & 1 \\ 3 & 2 & 0 & 1 \\ 4 & 1 & 1 & 0 \end{pmatrix}$$

We can see from this that the numerically sorted samples differ roughly as much (in fact in all these cases less) as the non-sorted samples. So if needed the numerical sortings should give a good estimate of the differences between samples.

Random data compression

For a given k, the following green cell will create a vector of length 2^k composed of random digits from 0 to 4 and
will find the W_i and output a graph showing the number of singular values of the i-th SVD
Will show the total number of singular values after the graph

```
k = 10;

Importantly this shows the general pattern of compressibility for random data and look like much of what we've gotten for when we used DNA samples.
Also show the peaks are generally wider for even k

Computation of 4-sample concatenated PCV1 data set

Results of this computation given here, don't want to re-run the algorithm each time as it takes too long, but used the bluebox algorithm to get each SVD

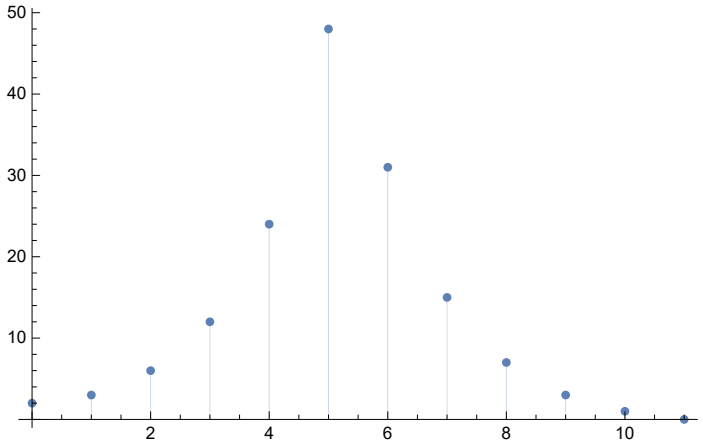
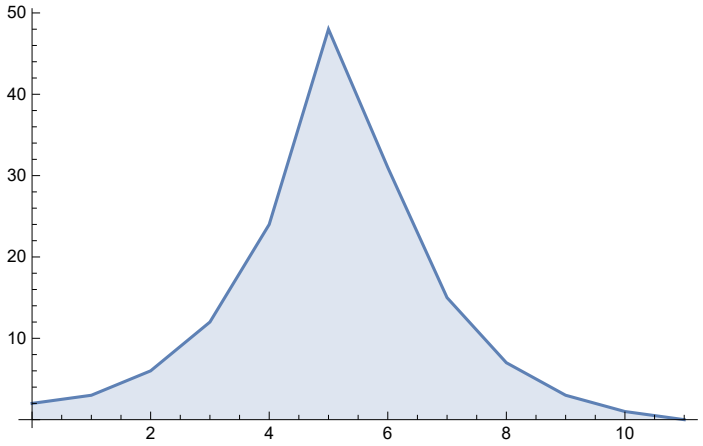
Results of 4-sample PCV1 SVD

```
ListPlot[{{0, 2}, {1, 3}, {2, 6}, {3, 12}, {4, 24}, {5, 48},
  {6, 31}, {7, 15}, {8, 7}, {9, 3}, {10, 1}, {11, 0}}, Filling → Axis]
```



```
ListLinePlot[{{0, 2}, {1, 3}, {2, 6}, {3, 12}, {4, 24}, {5, 48},
  {6, 31}, {7, 15}, {8, 7}, {9, 3}, {10, 1}, {11, 0}}, Filling → Axis]
```



These plots show the number of Singular values vs. the number of SVD's performed

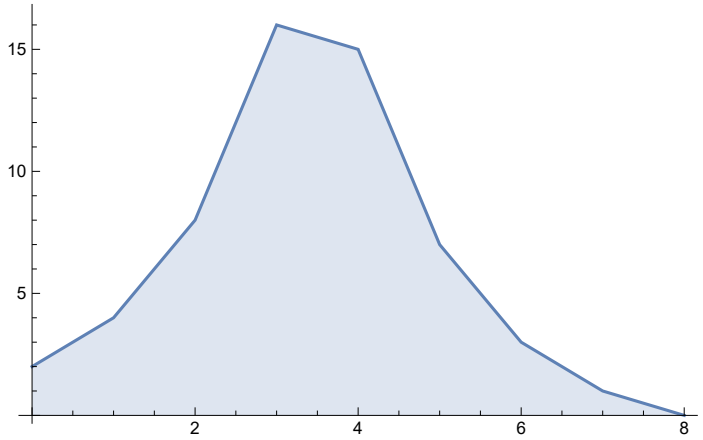
Peak number of Singular values occurs at 5th SVD

2+3+6+12+24+48 = 95 SV's occur for i = 0 to 5, before/up to the peak,

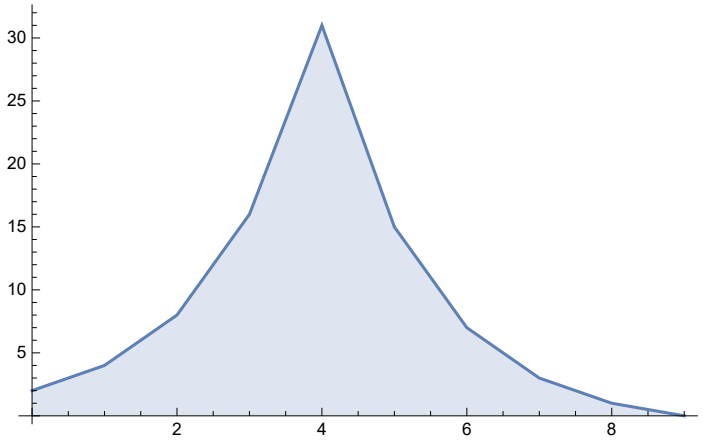
31+15+7+3+1 = 57 SV's occur for i = 6 to 10, after the peak

Compare this plot to that for H1A and $PCV1_1$ single-sample compression:

```
ListLinePlot[{{0, 2}, {1, 4}, {2, 8}, {3, 16}, {4, 15}, {5, 7}, {6, 3}, {7, 1}, {8, 0}},
 Filling → Axis] (*For H1A *)
```



```
ListLinePlot[{{0, 2}, {1, 4}, {2, 8}, {3, 16}, {4, 31},
  {5, 15}, {6, 7}, {7, 3}, {8, 1}, {9, 0}}, Filling → Axis] (*For PCV1₁ *)
```



So this method seems to impove compressibility a bit compared to the compression of H1A, but not as much for the compression of $PCV1_1$ alone

Also note that PCV1 virus lacks genetic diversity, so samples are very similar. This might be why it doesn't compress much better than $PCV1_1$ alone

Timing

Timing function gives CPU time used
AbsoluteTime gives real time used (i.e. CPU time + time it takes to display + other things))
RandomInteger[{0,4}] gives a random integer from 0 to 4 (base pairs + filler number 4)

```
AbsoluteTiming[Total[Range[123456]]]
Total[Range[123456]] // AbsoluteTiming

The above blue cell defines the following functions
CPUTimeItTakes[k] calculates how much CPU time is needed to perfrom the SVD algorithm
AbsTimeItTakes[k] calculates the absolute time it takes, CPU time + other
Computer must devote CPU time to other tasks, the time of these tasks as well as the CPU time of the calculation itself are included in Absolute time
So CPU time is a more accurate measure of efficiency

ClearSystemCache[] clears anydata stored. For instance, in the cell below the first function will give around a third of a second of cpu time, whereas the second same function will give 0 since its already been done and stored in the cache. The third fn time is after a clearing of the cache so takes around the same as the first rather than 0
Note that clearing the kernel may not clear the cache, as this does.
