```

ListLogPlot[{maxbondDim, numofNONzeroλof4samplePCV1, numofNONzeroλof4genelengthLISTOFALL1, numofNONzeroλof4genelengthLISTOFALL0}]

Key:

Blue - max bond dimensions (also random sets since they overlap) yellow - combined DNA sample catenation green - list of all 1 (also same for ists of all 2 and all 3) red - list of all 0

We test lists of solely one digit (the bottom two bond dimension plots) so as to have something to compare the other stuff to. Importantly, we can see that the algorithm doesn't give the maximal number of bond dimensions in the latter half of the plot for these highly compressible sets. Contrast this with the DNA plot

Note: break the MPS down to 2x1 at end but don't do 1x2 at beginning. This is why it may appear a bit assymmetric, not due to an error.

## 16 sample case
